14-15 F.4 2nd TERM EXAM-MATH-EP(M1)

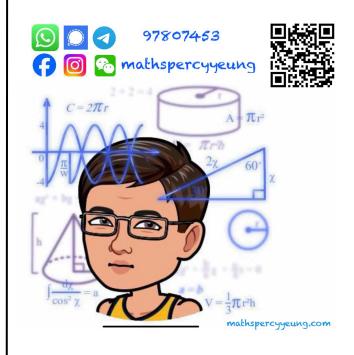

MATHEMATICS Extended Part Module 1 (Calculus and Statistics) Question–Answer Book

17th June, 2015 8:15 am – 9:45 am Time Allowed: 1 hour 30 minutes **This paper must be answered in English**

INSTRUCTIONS

- 1. Write your name, class and class number in the spaces provided on this cover.
- Answer ALL questions in this paper. Write your answers in the spaces provided in this Question-Answer Book. Do not write in the margins. Answers written in the margins will not be marked.
- 3. Unless otherwise specified, all working must be clearly shown.
- 4. Unless otherwise specified, numerical answers should be either exact or given to 4 decimal places.
- 5. The diagrams in this paper are not necessarily drawn to scale.

| 7. | In a city, the population of elder people x (in millions) at time t (in years) can be modelled |
|----|----------------------------------------------------------------------------------------------------|
| | by |

$$x = \frac{5(t+0.3)}{\sqrt{t^2 + 3t + 6}} \quad \text{for} \quad t \ge 0.$$

On the other hand, the death rate of the city R% can be modelled by

 $R = a e^{bx}$, where a and b are positive constants and $x \ge 0$.

- (a) Express $\ln R$ as a linear function of x.
- (b) The values of R when t = 0, 1, 2 and 3 are recorded as follows:

| t | 0 | 1 | 2 | 3 |
|---|------|------|------|------|
| R | 1.28 | 1.47 | 1.60 | 1.68 |

- (i) Using the graph paper on Page 9, estimate the values of a and b. Correct your answers to 1 decimal place.
- (ii) Using the estimate values of a and b in (i), find the death rate after a long period of time.

Answers written in the margins will not be marked

Section B (23 marks)

8. A chemical is added to a bottle of liquid. The temperature $\theta(t)$ of the liquid can be modelled by

$$\theta(t) = \frac{4 + 20t + t^2}{e^{0.1t}} + k$$
,

where $\theta(t)$ is measured in °C, t ($t \ge 0$) is the time measured in seconds after the chemical has been added and k is a constant. It is given that $\theta(0) = 14$.

- (a) Find the value of k. (1 mark)
- (b) Find $\frac{d\theta(t)}{dt}$. (3 marks)

Answers written in the margins will not be marked

(c) Will the temperature of the liquid get higher than 100°C? Explain your answer.

| 9. | After starting the promotion of a movie, the rate of change of the daily number of visits to |
|----|----------------------------------------------------------------------------------------------|
| | the official website of the movie can be modelled by |

$$\frac{dN}{dt} = \frac{40k - kt}{e^{\frac{t}{40}} + 5t} \quad (t \ge 0) ,$$

where N is the daily number of visits (in thousands) recorded at the end of a day, t is the number of days elapsed since the start of the promotion and k is a positive constant.

It is given that at the start of the promotion, N = 2 and $\frac{dN}{dt} = 4$.

- (a) (i) Let $u = 1 + 5te^{-\frac{t}{40}}$, find $\frac{du}{dt}$.
 - (ii) Find the value of k, and hence express N in terms of t.

(7 marks)

(b) Find the greatest daily number of visits, correct to the nearest integer.

(2 marks)

Answers written in the margins will not be marked

- (c) It is known that after 80 days from the start of the promotion, the rate of change of the daily number of visits becomes constant.
 - (i) Find the constant rate, correct to the nearest integer.
 - (ii) Find the daily number of visits after 100 days from the start of the promotion.

(4 marks)
